

# *Forest Growth and Yield Models*

*What makes them Work and What Makes Them Fail?*

**David K. Walters**  
LandVest, Inc.

**Terry D. Droessler**  
Forest Analytics LLC

**Erin E. Smith-Mateja**  
US Forest Service

# Session 1 – Background and Model Description

## The Models:

### Overviews

FPS

FVS

ORGANON

Summary

**Forest Projection and Planning System (FPS)**

**Forest Biometrics Research Institute**

<https://forestbiometrics.org/>

**Forest Vegetation Simulator (FVS)**

**United States Forest Service**

<http://www.fs.fed.us/fmsc/fvs/>

**ORGANON**

**Oregon State University College of Forestry**

<http://www.cof.orst.edu/cof/fr/research/organon/>

# Session 1 – Background and Model Description

## Workshop Agenda:

### Overviews

FPS

FVS

ORGANON

Summary

**Overview of FPS, FVS & ORGANON**  
components, strengths, weaknesses & data requirements

**Model Evaluation**  
with data  
without data  
techniques

**Model Localization**  
is it necessary?  
basic adjustments

**Scenarios**

		Models		
		FPS	FVS	ORGANON
Model Attributes	Individual Tree-Based	Y	Y	Y
	Spatial Category	DD	~DI <sup>1</sup>	DI
	Equations	N	Y	Y
	Dbh-Driven	N	Y	Y
	Height-Driven	Y	N	N
	Support/Updates	Y	Y	N
	Relational DB	Y	Y	N (DLLs) <sup>2</sup>
	Extensions	N	Y	N
	Age Invariant	Y	Y	Y
	Time Steps	Variable <sup>3</sup>	Variable <sup>4</sup>	5 years (RAP is 1 year)
	Applicable Area	Western States +	US	NWO, SWO, SMC, RAP
	Young Stand Growth	Y	Y	N <sup>5</sup>
	Ingrowth Model	Y	Y	N
	Cost	Variable <sup>6</sup>	Free	Free
	Source Code Available	N	Y	Y
Calibration Possible	Y <sup>7</sup>	Y	Y	

- 1: semi-DI since some FVS variants use plot level densities (plotBAL or plotBA) in the growth equations
- 2: Dynamic Link Library files allow users to call ORGANON routines from spreadsheets and databases
- 3: a growth step is years to 20' height growth with linear interpolation to specified time steps
- 4: recommended 5 or 10 year growth step depends on variant, but can specify number of years in steps
- 5: heights must be > 4.5', an even age stand must be a minimum age of fifteen years
- 6: FBRI membership fee is currently \$0.03/acre with a \$1,500 minimum and \$35,000 maximum
- 7: Survival and height growth to 20' can be "calibrated" in a silvics regime via PctSur and PctHt

# *How trees grow*

- Diameter growth
- Height growth
- Survival
- BA: combines D & S
- Volume: integrates D, H & S (with taper)

# *How tree growth is modeled*

- potential growth with modifiers
- competition, health, resources, etc.
- diameter growth drives height and survival
- height growth drives diameter and survival

# Session 1 – Background and Model Description

## Attribute Overview

Overviews

**FPS**

FVS

ORGANON

Summary

- **Distance dependent**
  - spatially explicit via stem map or clump index**
  - Stand.Clump defaults to 0.75**
  - competitive stress index (crown overlap)**
- **Grows in 20' height steps with linear interpolation**
- **10 meter site index**
- **Nonparametric (estimates in FBRI\_lib.mdb tables)**
  - “certified status”**
- **Reads and writes to MS Access (perhaps others?)**
  - tables, queries, forms, reports, macros, modules**
- **Compiler, Expander, Re-merchandiser, Harvest Scheduler**
- **Components and data requirements to evaluate/calibrate**

# Clump 30% on full acre

StdID:0000000107 Regm: GROW Year: 1981

*Clump 60% on full acre*

StdID:0000000108 Regm: GROW Year: 1981

# Compiler clump estimate 87% on full acre

StdID:0000000109 Regm: GROW Year: 1981

# *Actual stem map on 0.2-acre plot*

StdID:0000000107 Regm: GROW Year: 1981

# 10 m site and site shape

## Attribute Overview

Overviews

**FPS**

FVS

ORGANON

Summary

Site Index has three components:

% early ht growth relative to 10m macro site (Silvics.PctHt)

10-meter macro site (meters per decade) (Admin.Site\_Phy)

% late ht growth relative to 10m macro site (Admin.Site\_Shp)

# 10 m site and site shape

## Attribute Overview

Overviews

FPS

FVS

ORGANON

Summary

10m macro site:  $(100/\#yrs \text{ from } 34' \text{ to } 67')$

10-meter macro site conversion:

$$10m = (BHSI-30)/10$$

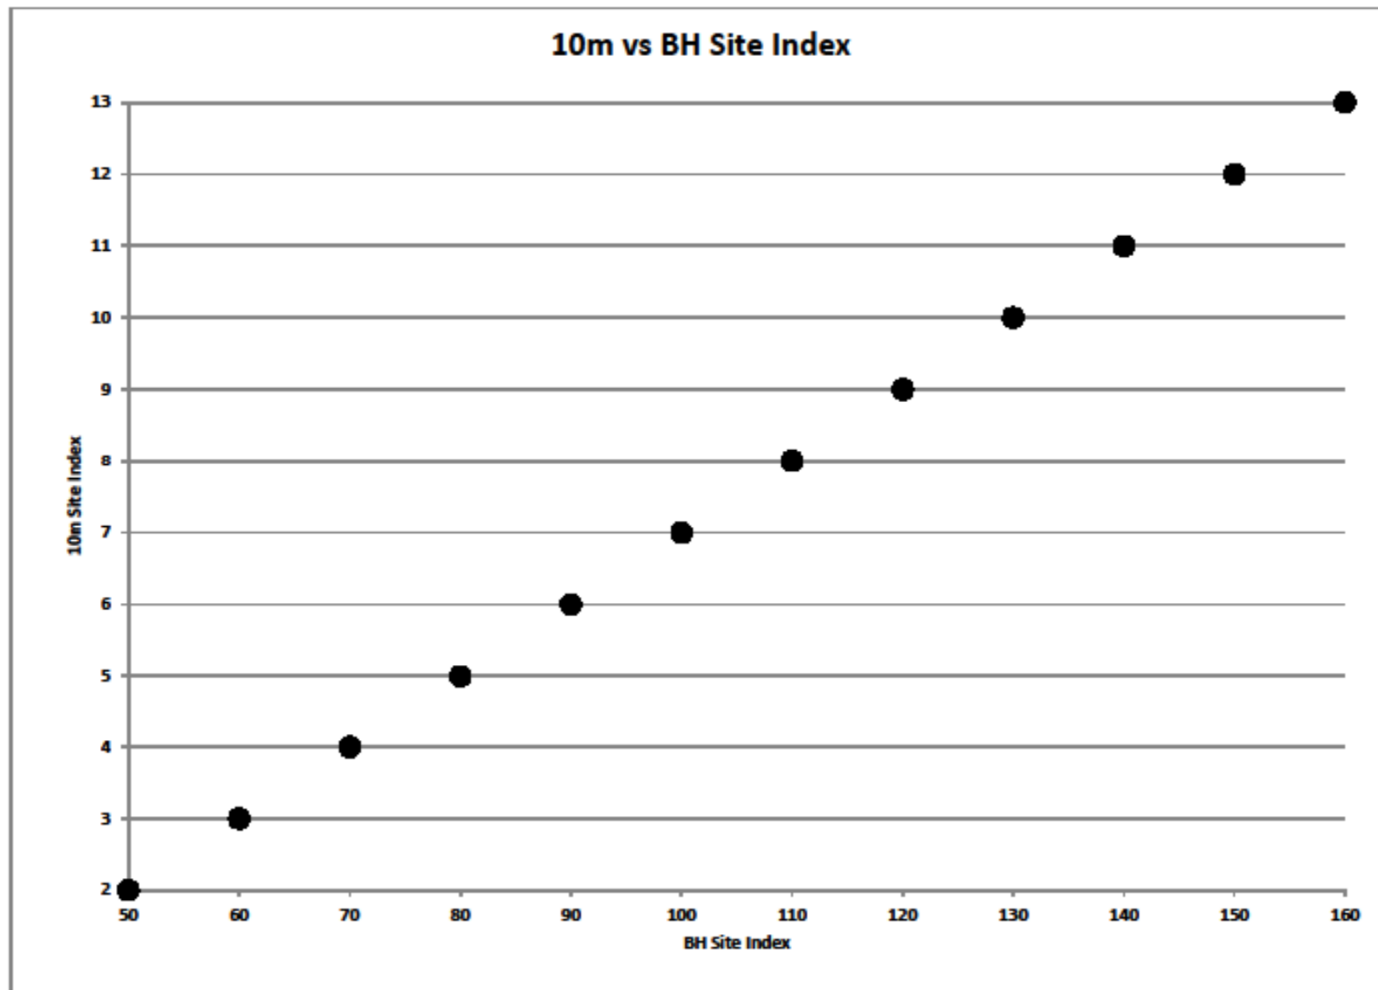

$$BHSI = (10m*10)+30$$

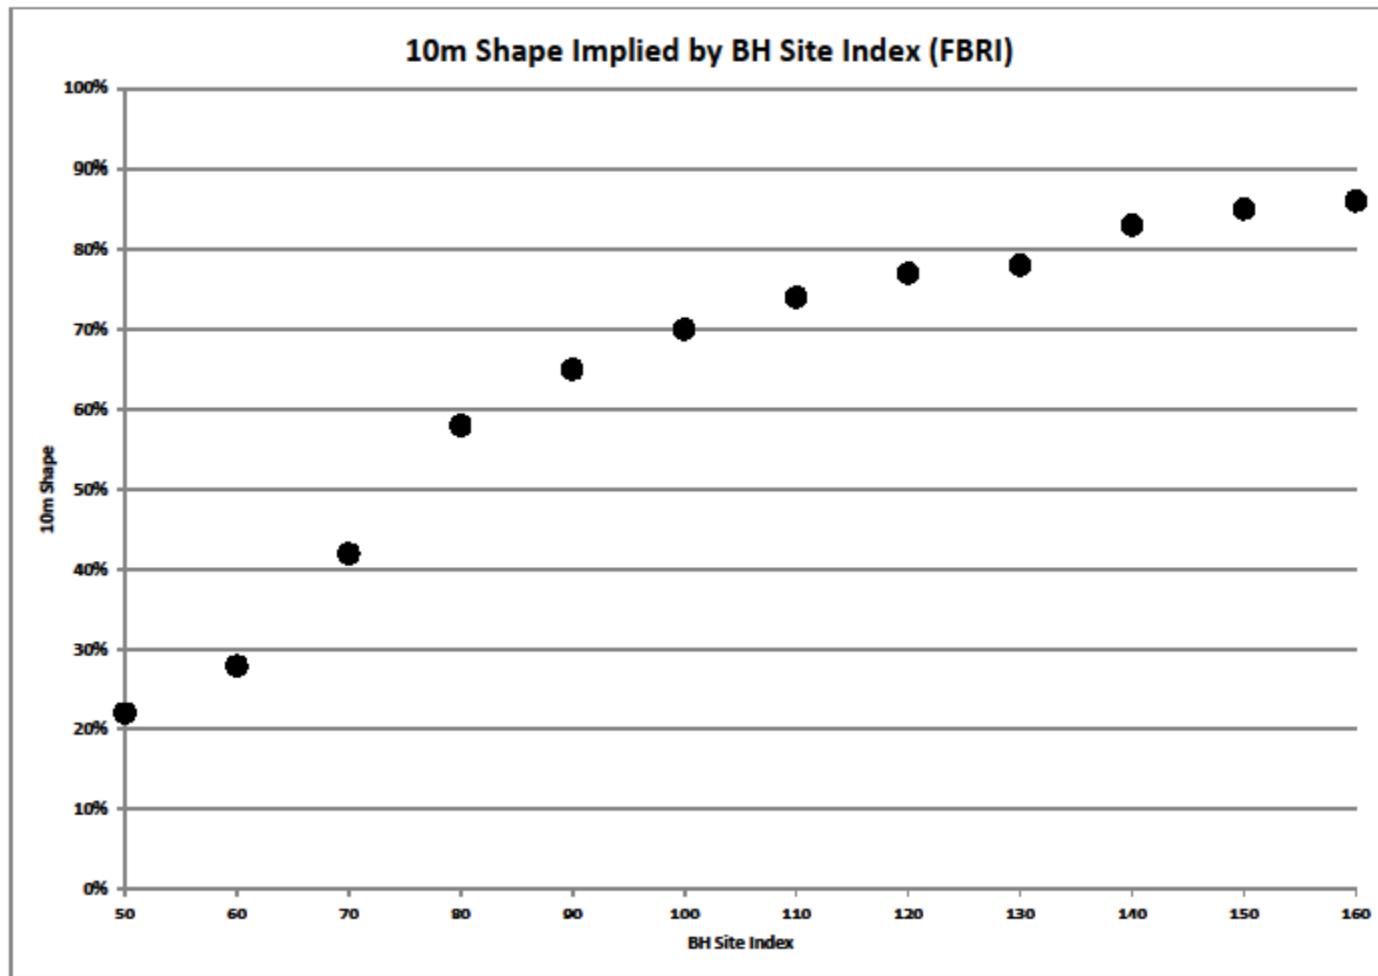

linear relationship

10m shape:  $(\#yrs \text{ from } 34' \text{ to } 67')/(\#yrs \text{ from } 67' \text{ to } 100')$

default in FPS 67%

shape is nonlinear if wanting traditional BH site behavior

### SI 125: Site Shape Comparison
