ORGANON

Summary

## ORGANON

- Single-tree, distance independent growth and yield model
- 4 Variants
  - SWO (Southwest Oregon)
  - NWO (Northwest Oregon)
  - SMC (Stand Management Cooperative)
  - RAP (Red Alder plantations)
- Variants should be applied to areas **appropriate** to same species mixture, stand structure, and maximum ages as modelling data set.

**ORGANON**

Summary

## ORGANON

- **SWO Oregon**
  - **Even and uneven-aged stands**
  - **20% of Basal Area in 5 major conifer species**
    - DF, GF/WF, PP, SP, IC
    - Minor species include WH, RC, JP, PY, PM, GC, TO, BO, WO, LO, BM, RA, PD, WI
  - **Wide Age range (5 – 250+)**
  - **529 Stands Measured**

**ORGANON**

Summary

## ORGANON

- **NWO Oregon**
  - **Even aged stands**
  - **80% of Basal Area in 3 major conifer species**
    - **DF, GF, WH**
    - **Minor species include RC, PY, PM, WO, BM, RA, PD, WI**
  - **Wide Age range (< 120)**
  - **136 Stands (DF, GF), 43 Stands (WH)**

**ORGANON**

Summary

## ORGANON

- Review – single tree / distance independent model
- Can predict development of:
  - Single & Mixed species stands
  - Even and Uneven-aged stands
  - Single or Multi-storied stands
  - Thinned & Unthinned
  - Fertilized
  - Pruned

**ORGANON**

Summary

## ORGANON

- **Data Requirements**
  - **For Each tree**
    - Species
    - DBH
    - Total Height
    - Crown Ratio
    - Expansion Factor
  - Site Index
  - Plot/Point Numbers

**ORGANON**

Summary

## ORGANON

- **Dynamic Equations**
  - Diameter Growth
  - Height Growth
  - Change in Height to Crown Base
  - Mortality
- **Static Equations**
  - MCW, LCW, Crown Profile
  - BT, CFV, Taper,
  - H:D, HCB, SI (Dom. Height)

**ORGANON**

Summary

## ORGANON

- **Each Equation**
  - **Has parameters specific to**
    - Each version of Organon
    - Each species in each version
  - **Parameters fitted**
    - To modelling data sets
    - With linear and nonlinear regression
- **Each dynamic Equation**
  - **Predicts development of the stand for five-year growth cycles**

- Summary

		Models		
		FPS	FVS	ORGANON
Model Attributes	Individual Tree-Based	Y	Y	Y
	Spatial Category	DD	~DI <sup>1</sup>	DI
	Equations	N	Y	Y
	Dbh-Driven	N	Y	Y
	Height-Driven	Y	N	N
	Support/Updates	Y	Y	N
	Relational DB	Y	Y	N (DLLs) <sup>2</sup>
	Extensions	N	Y	N
	Age Invariant	Y	Y	Y
	Time Steps	Variable <sup>3</sup>	Variable <sup>4</sup>	5 years (RAP is 1 year)
	Applicable Area	Western States +	US	NWO, SWO, SMC, RAP
	Young Stand Growth	Y	Y	N <sup>5</sup>
	Ingrowth Model	Y	Y	N
	Cost	Variable <sup>6</sup>	Free	Free
	Source Code Available	N	Y	Y
Calibration Possible	Y <sup>7</sup>	Y	Y	

- 1: semi-DI since some FVS variants use plot level densities (plotBAL or plotBA) in the growth equations
- 2: Dynamic Link Library files allow users to call ORGANON routines from spreadsheets and databases
- 3: a growth step is years to 20' height growth with linear interpolation to specified time steps
- 4: recommended 5 or 10 year growth step depends on variant, but can specify number of years in steps
- 5: heights must be > 4.5', an even age stand must be a minimum age of fifteen years
- 6: FBRI membership fee is currently \$0.03/acre with a \$1,500 minimum and \$35,000 maximum
- 7: Survival and height growth to 20' can be "calibrated" in a silvics regime via PctSur and PctHt
