

# Estimation of volume and products that can be obtained from individual stems using consumer grade cameras

Bogdan Strimbu

# Stem Measurements

# Ground estimation issues

- Time consuming
- Inaccurate (at the best first log)
  - Form factor (usually Girard)
  - Rarely measured in daily practice - guesstimation
- Lack precision (half log)

Tree Volume in Board Feet (International ¼)  
Number of useable 16-foot logs

Tree Diameter	1	1.5	2	2.5	3	3.5	4	4.5	5
10	36	48	59	66	73				
11	46	61	76	86	96				
12	56	74	92	106	120	128	137		
13	67	90	112	130	147	158	168		
14	78	105	132	153	174	187	200		
15	92	124	156	182	208	225	242		
16	106	143	180	210	241	263	285		
17	121	164	206	242	278	304	330		

# Objective

---

- **Main**: Develop a procedure that estimate tree products that is fast, accurate, precise, and inexpensive.
  - Focus on fast and accurate
- **Secondary**: prove that computer vision techniques provide fast and accurate estimates of stem attributes → dbh

# Structure from Motion

- Range imaging technique for estimating 3D objects from multiple 2D images

# Procedure

---

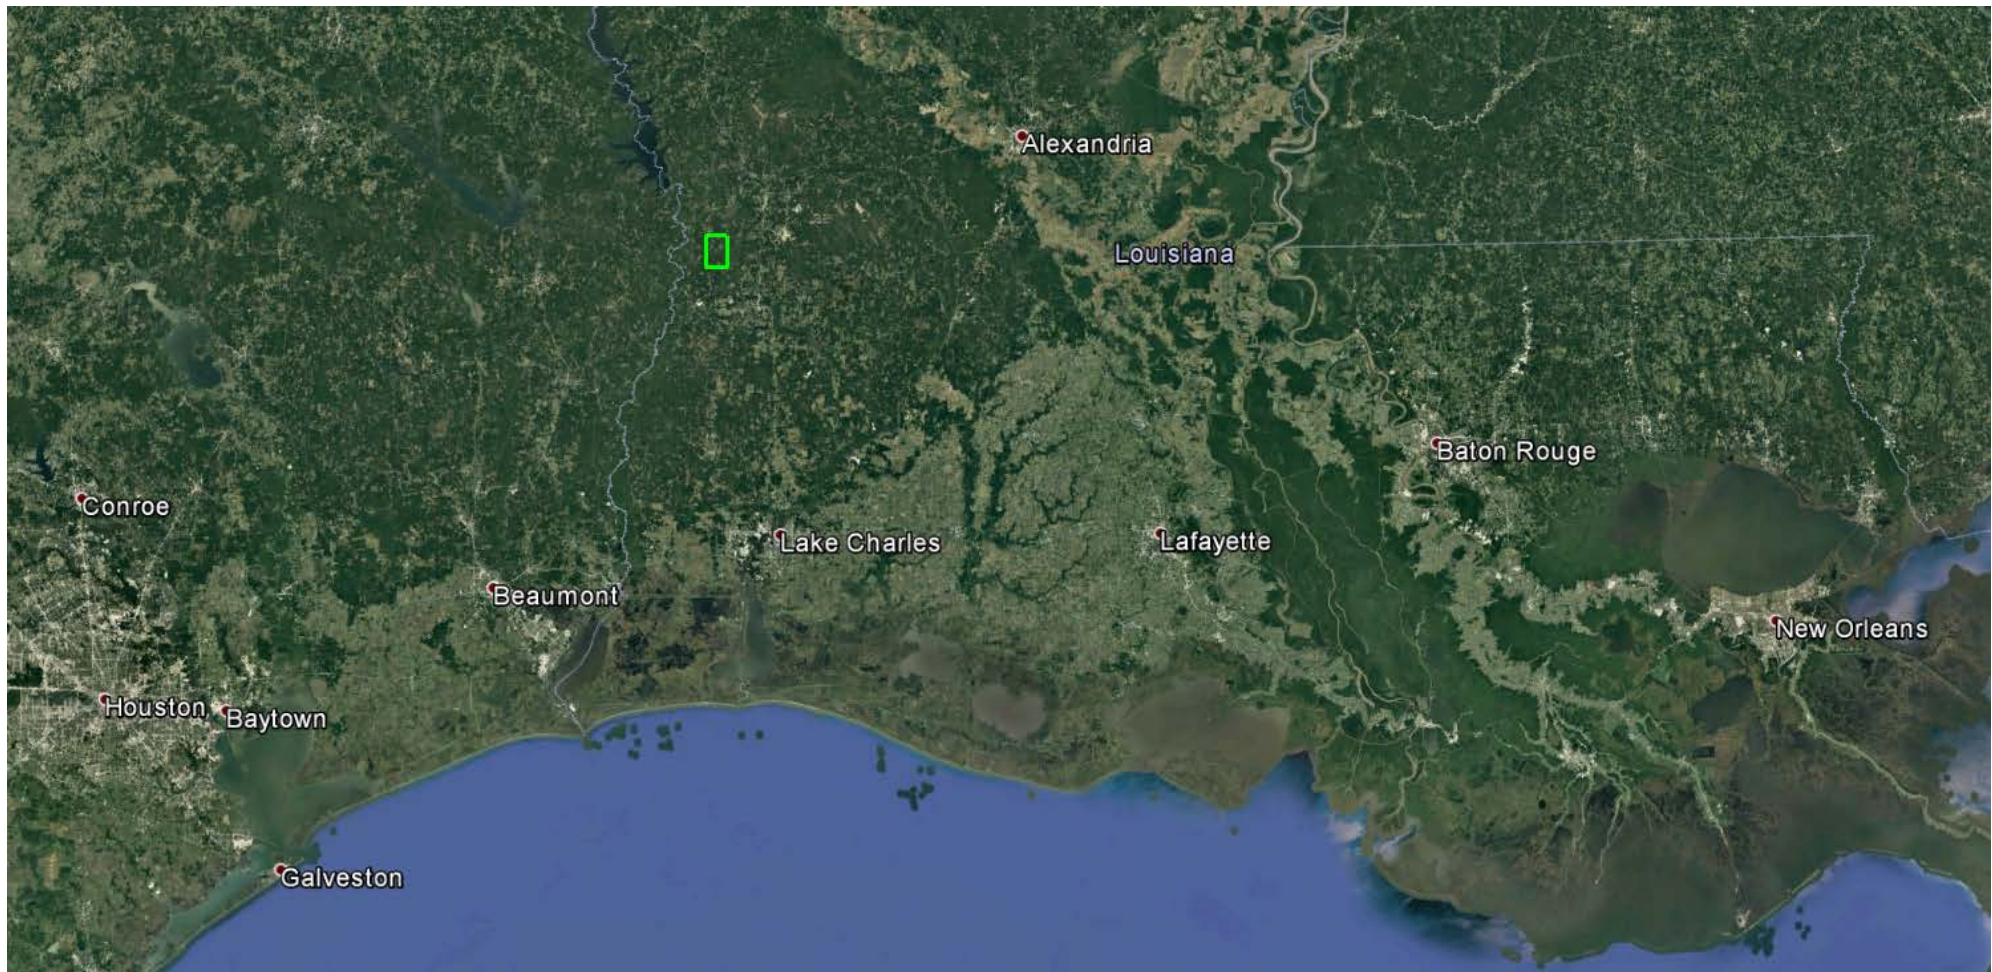

1. Record images
2. Create point cloud
3. Calibrate point cloud
4. Execute measurements
5. Corrections

# Species & Location

- Loblolly pine
- From first thinning to rotation age

# Location

# Input

- Nikon 3200- 24.2 Mpixels - \$700

# Photogrammetric Point Cloud

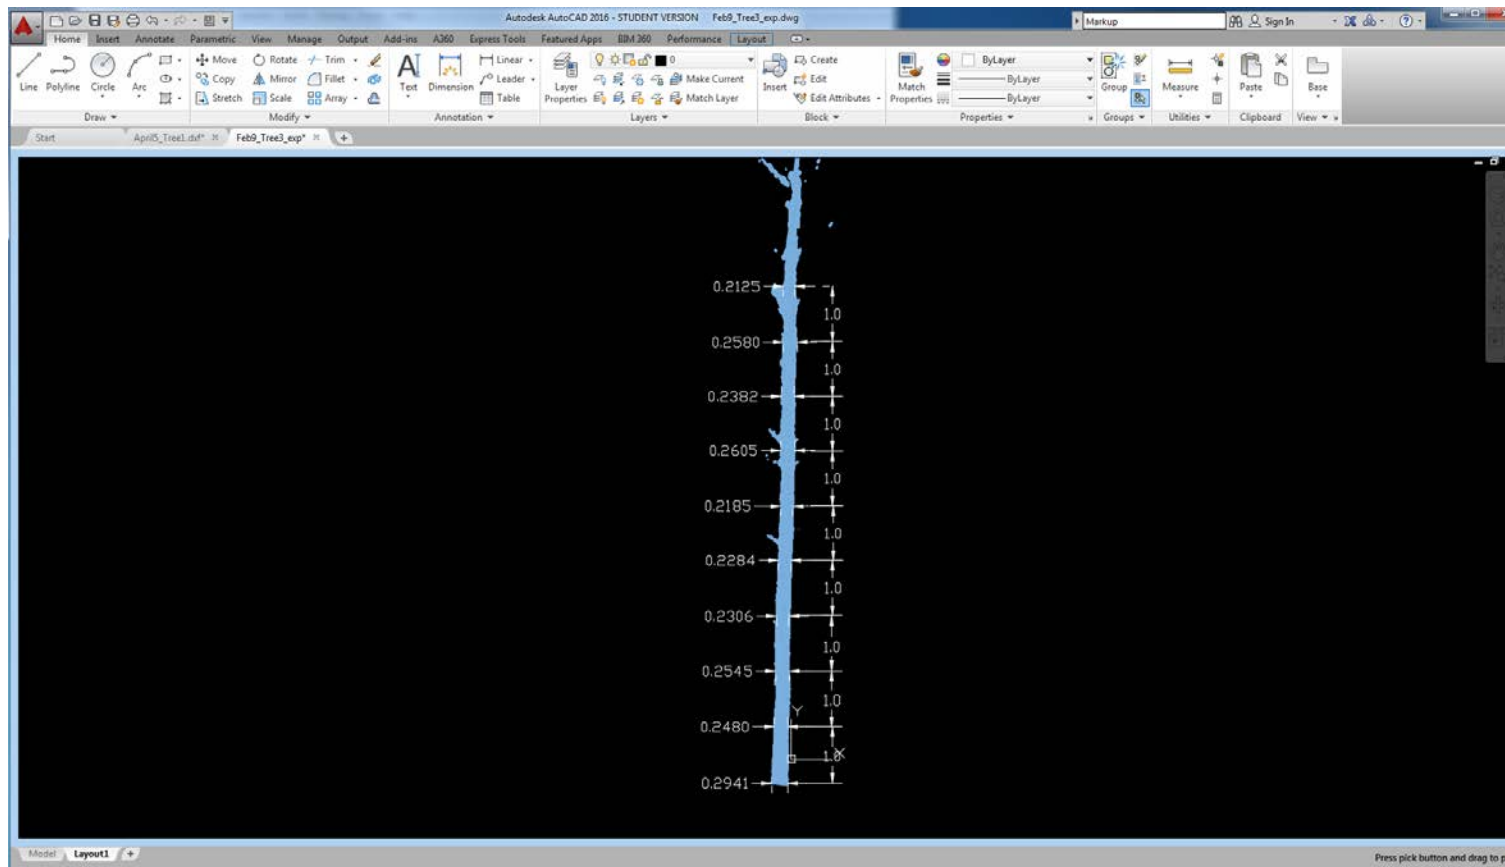

# PPC calibration

# PPC Measurements

# Bias

**Bias=1.72 cm**

$$\text{Bias @ height } h = d_{ppc} - d_{ground}$$

# Bias reduction

$$\text{bias}_{\text{correction}} = \text{error @ dbh} + \text{Calibration}_{\text{error}} \times \text{Relative Height}$$

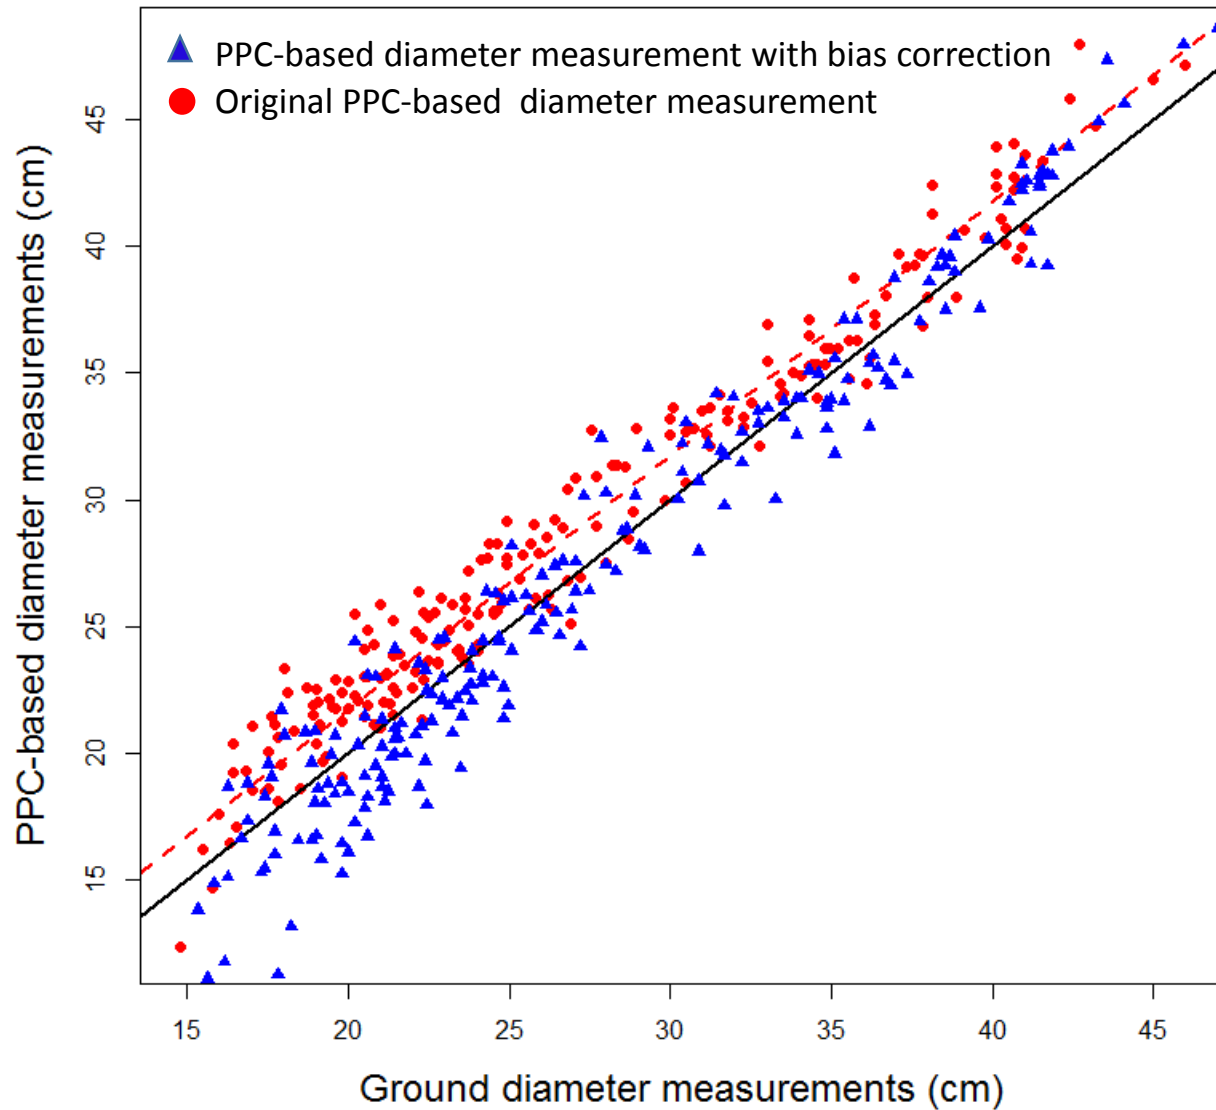

Calibration error is close to bias

# Diameters

# Bias reduction (2)

- After reduction: accuracy 1.5 mm

Height at which difference < 10% is  $\geq 10$  m

# Problems

---

1. Slow
2. Needs bias corrections for outside diameter

# Automatic measurements

---

- Complex combination of algorithms
  - Existing
  - Newly developed
- Compute INSIDE BARK diameter at any height
- Matlab

# Automation Results

# Automation Results

---

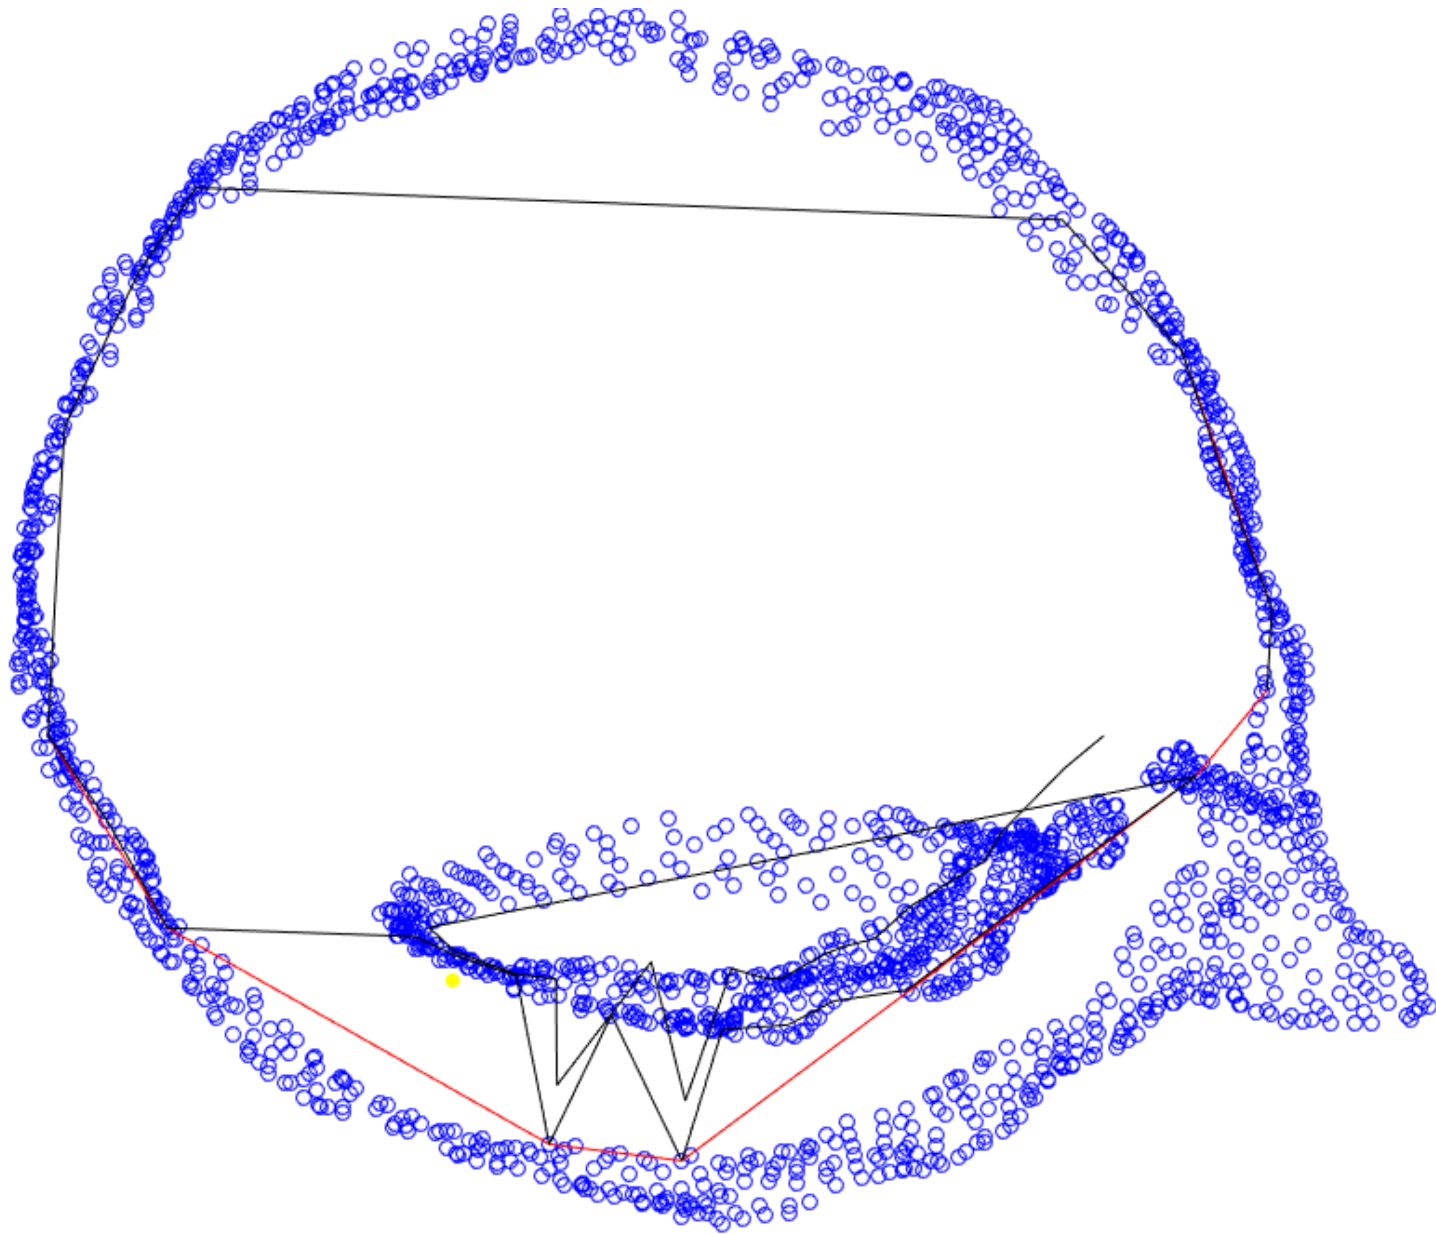

# Automation Results

# Issues

# Results

---

- Computation time: aprox. 250 sec
- Measurements every 4 inch
- Inside bark diameter
- Accuracy: more than 95%
- Depends on rendering process
