

Reforestation for the Future: Future Concerns, Shaping your Reforestation Plans and the Seedlot Selection Tool

Brad St.Clair

*USDA Forest Service, Pacific Northwest Research Station,
Corvallis, Oregon*

for the greatest good

38th Inland Empire Reforestation Council Meeting, Coeur d'Alene, ID, March 6, 2018

Objectives

1. ***Introduce the Seedlot Selection Tool***
2. ***Provide some examples***
3. ***Discuss implications of climate change***

Seedlot Selection Tool

Planting Healthy Forests

The seedlot selection tool (SST) is a GIS mapping program designed to help forest managers match seedlots with planting sites based on climatic information. The climates of the planting sites can be chosen to represent current climates, or future climates based on selected climate change scenarios.

1. **Select Objective**
You can find seedlots for your planting site or planting sites for your seedlot.
2. **Select Location**
You can click on the map or enter coordinates to locate your seedlot or planting site.
3. **Select Climate Scenarios**
You can select historical, current, or future climates for your seedlots or planting sites.
4. **Select Transfer Limit Method**
You can use an existing zone to calculate a transfer limit or enter your own custom limit.
5. **Select Species**
You can use species-specific or generic zones and transfer limits.
6. **Select Zone**
If you use the zone method, you can select among the available zones for your location.
7. **Select Climate Variables**
You can use a variety of climate variables to match your seedlot and planting site.
8. **Map your Results**
The map shows where to find appropriate seedlots of planting sites.

Planting Healthy Forests

The seedlot selection tool (SST) is a GIS mapping program designed to help forest managers match seedlots with planting sites based on climatic information. The climates of the planting sites can be chosen to represent current climates, or future climates based on selected climate change scenarios.

for the greatest good

Background

1. Plants are adapted to local climates

Douglas-Fir Seed Source Movement Trial

Floras – warm site

Frost-free days = 308

Doorstop – cool site

Frost-free days = 190

Local adaptation

Sources from climates similar to the planting site are among the tallest at each site

for the greatest good

Lessons from Forestry

- *Early observations of poor growth and survival*
- *Maladaptation took time to develop*
- *Led to first seed movement guidelines in 1939*
 - *100 miles north or south*
 - *1,000 ft in elevation*
 - *Considerations for unusual climates, topography or soils*

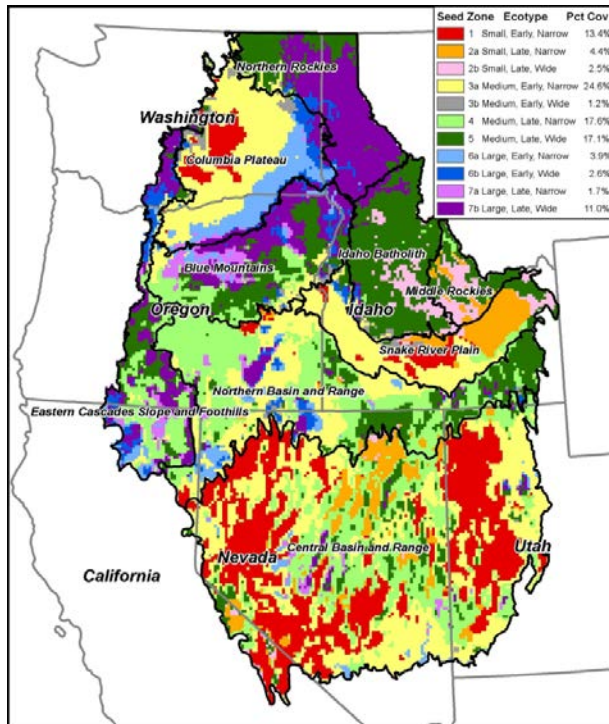

2. Seed zones and population movement guidelines developed to ensure adaptation

- *Based primarily on collective knowledge of climate and vegetation types*
- *Includes 500 ft elevation bands within zones*
- *Later revised in OR and WA to account for species-specific patterns of adaptation*

2. Seed zones and population movement guidelines developed to ensure adaptation

Bluebunch Wheatgrass Seed Zones

St.Clair, Kilkenny, Johnson, Shaw, Weaver. 2013. Genetic variation in adaptive traits and seed transfer zones for *Pseudoroegneria spicata* (bluebunch wheatgrass) in the northwestern United States. *Evolutionary Applications* 6: 933-948

Generalized Provisional Seed Zones

Bower, St.Clair, Erickson. 2014. Generalized provisional seed zones for native plants. *Ecological Applications* 24: 913-919

Climate Change

Do we really need to worry about climate change?

Two questions:

- 1. Are native populations adapted to current and future climates?***
- 2. If not, how far do we have to go to find populations adapted to a planting site (assisted migration)?***

Answer:

"Now, here, you see, it takes all the running you can do, to keep in the same place."

Do we really have to worry about climate change?

1. ***Are native populations adapted to current and future climates?***
2. ***If not, how far do we have to go to find populations adapted to a planting site (assisted migration)?***
 - *In the short-term (next decade, maybe two), local populations are adapted to the local climate (within range of current transfer guidelines)*
 - *Better-adapted populations may be found at lower elevations or further south*
 - *In the long-term (by mid- to late-century), local populations are at high risk of maladaptation to the projected climates*
 - *Adapted populations (i.e., from similar climates as present) are found pretty far away, generally far south*
 - *In some cases, no analogous climates exist in the future*

"Now, here, you see, it takes all the running you can do, to keep in the same place."

Climate change considerations

- *Decisions now may have long-term implications.*
- *Artificial regeneration will be more important in the future because of climate change.*
- *Most critical phase is stand establishment; although climate is a moving target, choose sources adapted to climates of the next 20 yrs.*
- *Large moves are not necessary; move to planting sites that are 2°C cooler than present; within current seed movement guidelines.*
- *Use mixtures of seed sources to account for uncertainty and climate change over the life of a stand.*
- *Seed zones and seed movement guidelines should be based on climate rather than geography; bulked over a smaller climatic range.*
- *Consider gene conservation activities to conserve populations.*
- *Research is important, but lack of knowledge is not an excuse for inaction.*

Summary

- *Powerful tool to explore where climates occur now and how those change in the future*
- *Allows user to determine appropriate seedlots or populations for reforestation or restoration*
- *Allows users to explore different assumptions*
 - *Climate variables important for adaptation for species of interest*
 - *Appropriate transfer limits for species of interest -- as well as risk level of user*
 - *Time periods of concern for adaptation*
 - *Future emission pathways*
- *Tool is only as good as the knowledge behind it*
 - *Climate interpolation*
 - *Climate change scenarios*
 - *How species are adapted to their environments*

About Tool Saved Runs

Elevation: 2221 ft (677 m)

3 Select region

Automatic Custom

Region: Western US

4 Select climate scenarios

Which climate are the seedlots adapted to?

1961 - 1990

When should trees be best adapted to the planting site?

1981 - 2010

5 Select transfer limit method

Custom Zone

6 Select climate variables

Units: Metric Imperial

Seedlots for planting site in Oregon Cascades

About Tool Saved Runs

1 Select objective

Find seedlots Find planting sites

2 Select planting site location

Locate your planting site
Use the map or enter coordinates

Lat: 44.4259 Lon: -122.3328

Elevation: 3002 ft

3 Select climate scenarios

Which climate are the seedlots adapted to?

1961 - 1990

When should trees be best adapted to the planting site?

1961 - 1990

4 Select transfer limit method

Custom Zone

5 Select climate variables

Units: Metric Imperial

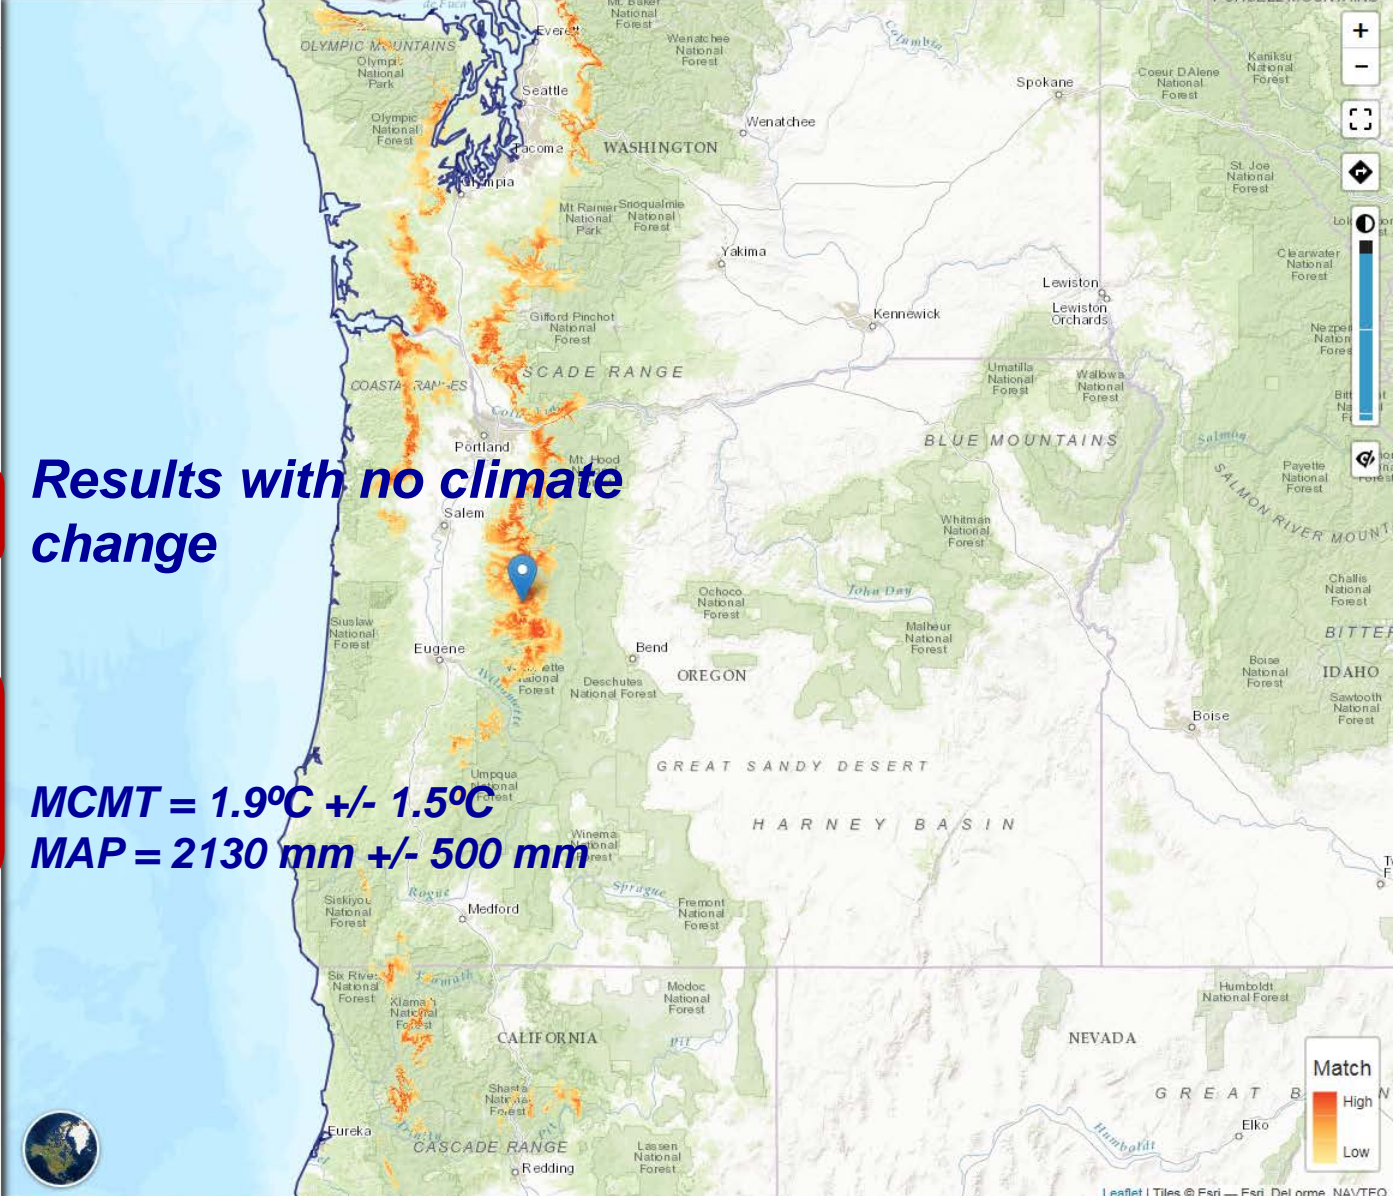

Name	Center	Transfer limit (+/-)
MCMT	1.9 °C	1.50 °C
MAP	2130 mm	500 mm
