

Beyond Averages, Transforming Data Into Information

March 4th, 2019

A Division of Hancock Timber Resource Group, A Manulife Asset Management Company Bruce Ripley Strategic Innovation Manager

17700 SE MI Plain Blvd, Suite 180 Vancouver, WA 98683 360-260-4577 bripley@hnrg.com htrg.com

Beyond Averages Transforming Data Into Information.

What do I mean by "Beyond Averages"?

Manager: How are our plantations doing?

Forester: Great! We have the best plantations in the industry! Here's some data...

Plantation 1 has 260 TPA and the 2 year survival is 72% Plantation 2 has 225 TPA and the 2 year survival is 57%

Manager: What about the whole program?
Forester: Let me get back to you on that... (months go by...) Ok, I walked some it and it all looks good!
So how much information have we provided? Not much really
Certainly not enough to understand how to measure success, detect trends, or identify key indicators of success or failure.

What are we going to talk about?

- Define the problem, what's a plantation?
- What have traditional survey programs looked like?
- What kinds of data do they normally provide?
- Where do current systems come up short?
- What could a better system look like?
- Feedback from REAL users
- How to make the change: The Roadblocks
- Potential Roles for Remote Sensing
- Conclusions: Developing actionable information

Starting point: Planted, Natural, Hybrid?

Does the starting point matter? I'd tell you "No" Well designed systems should be able to describe these accurately What are we trying to estimate? Counts...

Plantations: Monitor Development?

What's our goal:

- Evaluating change
- Certify compliance at a specific point in time
- Providing a reference for prescribing a value

Face Reality:

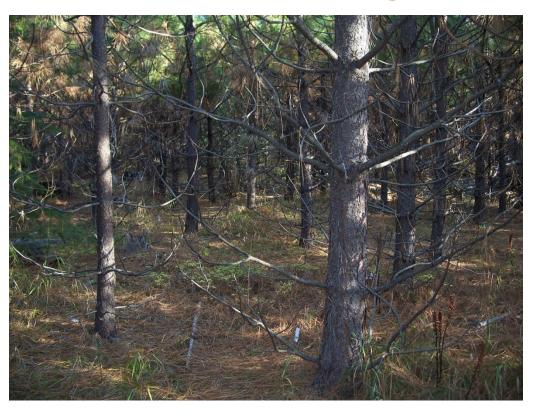

- Not all regeneration events are successful, planted, natural, or a hybrid.
- If everyone says that they have the "best plantations" someone is lying.
- Even if you are the best, what's your current trend?

Plantations: What's the goal?

Maximizing productivity for your desired product

- **1.** Capture the site productivity
- **2.** Stock each productive spot at a product appropriate density

Traditional Regeneration Surveys Types of Data Provided

Collected and stored in Excel

PLOT	TREE	COUNT	TYPE	SPECIES	HEIGHT	CON 1
1	1	0				
2	1	3	R	DF	25	
	2	1	R	GF	4	
3	1	5	Р	DF	1	
	2	2	R	WL	20	
4	1	4	Р	DF	1	
5	1	5	R	DF	4	
	2	2	N	WL	3	

What information do we have?

- Total TPA
- Planted TPA
- Natural TPA
- Species Breakdown

A Division of Hancock Timber Resource Group, A Manulife Asset Management Company

Typical Data Summary

REGENERATION CRUISE SUMMARY REPORT

Unit Name	Bob
Cruise Date	10/20/2010
Cruiser	them
Acres	76
Seedlings Planted Per Acre	295
Total TPA	260
Planted TPA	168
Natural TPA	92
Percent Seedling Survival	57%
Plantable Acres	29.25
Percent Plantable	45%
Average Height	0
Stocking Percentage by Species	
DF	92%
WL	8%
PP	0%
RC	0%
GF	1%

Traditional Regeneration Surveys

How are they stored? Likely as individual workbooks Here is an example of 3 years of data

Management®

Traditional Regeneration Surveys

Where do current systems come up short?

- L-o-n-g on opinion / Short on information
- Information is hidden, no flexibility to easily interrogate the data
- QA/QC is inefficient, data errors are buried in each sheet
- No single authoritative source of the "truth"
- Very limited reporting, especially in terms of spatial reporting
- It can be months before all data is fully available
- The only real solution to address most of these issues is <u>brute</u> <u>force</u>, which is very common and very inefficient.

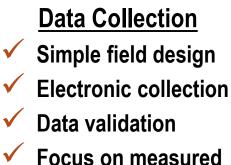

What a Better System Might Look Like

Characteristics of a better system

- Sample design would be simple
- Plots would be revisited at least once for actual survival
- Users would not have to compile data
- Analytical data is easily available
- Data would keep spatial awareness

Focus on measured data not subjective

Hancock Forest Management®

A Division of Hancock Timber Resource Group, A Manulife Asset Management Company

Data Compilation

- Data sync would be simple
- Automated compilation
- Automate QC when possible

Data Analysis More than TPA Multi-level analyses using

- same metrics
- Maintain spatial integrity

A Better System: Multiple Summary Levels

The same tool can summarize at multiple levels User learns how to use one tool

All levels of detail are available for the whole program

Feedback From Real Users

• What is the number 1 result from implementing a new program?

- Spatially explicit, statistically backed data
- ✓ Amazing analytical tool for comparing stock sizes, species, nursery...
- Better data summaries, and data is more quantitative

• One thing you've learned that you didn't know?

- I have a better handle on actual survival and not just stocking
- ✓ Planted tree survival is more variable than I expected

• One thing you've changed to improve your program?

- Not one thing but the reporting stability is allowing for continuous improvement.
- I improved stock type selection. I replaced a specific poorly performing stock type and replaced it with stock types that have consistently had better performance.
- ✓ My knowledge about specific stock types and nursery's has improved

How to make the change: The Basics

- **1.** Decide what is important
- **2.** Carefully decide what attributes to collect
- **3.** Avoid collecting attributes because they might be interesting
- Keep your sample as simple as possible, use one design
- **5.** Smaller plots are ok... your stats will tell you how you are doing

Current Assumption	<u>Reality</u>
Your survival is very good	It's not…
Not many trees die year 2	They do…
Naturals will bail me out	They might, but probably wont
	Naturals are poorly distributed

Survival isn't affected by stock typeIt probably is...Survival isn't affected by nurseryIt probably is...

How to make the change: The Roadblocks

- 1. Culture
- **2.** You already know the answers, sometimes before planting...
- 3. Culture
- 4. "My" region is completely different, that won't work here
- **5.** That might work for DF but it can't work for "my" species
- 6. We don't have a fancy database system like you
- 7. We don't know how to program
- 8. We don't have the experience to build a system
- 9. <Fill in your own rationalization here>

Potential Roles for Remote Sensing

- Could we use the remote sensed data with this design? Yes
- Can the current technology provide enough accurate data? No
- There are limits to current remote sensing technology
 - What about drones? Drones are just a platform
 - What about LiDAR? Not Yet
 - What about 6" imagery? Not Yet
 - What about 1" imagery? Not Yet
- Could all of these technologies be used with trees that were just a bit bigger? Yes
- How big? That depends...

Conclusions: Developing Actionable Data

- Simple data will tell you a bit about what you have now but it does not provide much depth.
- Developing a system that provide actionable information does not need to complicated.
- Actionable information should help you:
 - Avoid the trap of trying to understand complex problems by only looking at high level summary data.
 - Understand your problem from the highest summary levels down to the lowest level of detail
 - ✓ Help you identify the most important factors leading to success or failure
 - ✓ Allow you to make decisions based on data rather than opinion
